Proof Load = The rated load a bolt must be capable to withstand without permanent set (damage or elongation).

Yield Strength = The load capabilities of a bolt as measured electronically with an extensometer + recorder.

Tensile Strength = The maximum load (tensile strength) a bolt is capable of sustaining.

**This table is to be used only as a guide. The values given are the maximum that should be used.**

The torque values are proposed standard torque values for industrial metal fasteners.

The values given are the maximum that should be used, and are 60% to 70% of the lowest failing torque of any of the test group.

The tension achieved from any torque is directly related to the friction occurring during the fastening process. The greater the friction the less the resulting tension.
